

	A lovely Title	Right aligned text <i>not yet implemented</i>
----------------------------------------------------------------------------------	----------------	--------------------------------------------------

This is a test header. These details should be displayed on every page. This dull and meaningless text should stretch across the entire page, and then wrap around onto a second line.

Here is an example of hardcoded data, created via a callback function which returns html.

Unfortunately, the header tags don't yet work these can be added in the s3codecs/pdf.py file

Volunteer Service Record			
	Name	Organisation	Email
	Mr. Administrator, Sir	Example	admin@example.com

So here is a list of features that could be added.

Extend basic html tag support: H1, H2, etc, LI, etc

Add support for standard attributes: align, valign, etc

Make the header and footer fit on a landscape page if the table changes the page layout

Be able to control the width of table cells, being more smart about this would be good, but probably harder to implement. See the above tables the cells in the heading are all the same width. The inner table overflows the outer table.
